

## **PORTABLE AIR COOLING SYSTEM**

### **ABSTRACT OF THE DISCLOSURE**

A portable cooling system includes an air  
5 cooling unit, a housing enclosing the air cooling  
unit, an output port, and flexible tubing. The air  
cooling unit includes an air intake, an air cooler,  
an air output, and a blower. The blower is configured  
to drive air from the outside through the air cooling  
10 unit. The air cooler is configured to cool air  
received through the air intake. The cooled air is  
then discharged through the air output by the blower.  
The output port is connected to the air output for  
receiving the cooled air. The flexible tubing  
15 includes a first end that is coupled to the output  
port and can be used to deliver the cooled air to a  
portable personal shelter.
